T T S S Kiran Kumar

@(saikiranestb94@gmail.com) #(+91 9989268080)

Professional Summary

- Having a strong and diverse software development experience with an emphasis on analysis, design, and development. Keen and adept at learning and mastering new technologies.
- Over 7+ years of working experience as a developer building web-based applications, data pipelines, and IoT solutions.
- Strong problem solving & technical skills coupled with confident decision making, for enabling effective solutions, and leading to high company satisfaction.
- Possess strong soft-skills and have the experience of managing an outsourced tech team. Have taken the initiative to interact with clients on multiple occasions.
- Applied knowledge on agile methodologies and sprint development life cycles.

Technical Skills

Having developed web-app solutions for over 6 projects, I carry a mastery of many web frameworks and libraries. My primary job-title being Full-Stack developer, I have connoisseur-ed various tech-stack elements, comparing each to decide the best technology suited for a project.

- **Languages:** JavaScript, Java, Ruby, C#
- **Frameworks:** React, Rails, Sinatra
- **Cloud:** AWS (Lambda, SQS, DynamoDB, CloudWatch, SNS, S3, API Gateway), Firebase
- **Databases:** MongoDB, ElasticSearch, MySQL, PostgreSQL, Oracle

Educational Qualifications

M.S/M.Sc(Science)-Chemistry (2011 - 2016)

Birla Institute of Technology and Science (BITS), Pilani

B.Tech/B.E.- Electronics and Instrumentation (2011 - 2016)

Birla Institute of Technology and Science (BITS), Pilani

Professional Titles

- **Senior FrontEnd Developer** at MyTeru Technologies.
- **Senior FrontEnd Developer** at Engineering Square Technologies.
- **Senior FrontEnd Developer** at Phoenix Technologies.
- **FrontEnd Developer** at Rapidue Technologies.
- **External Consultant** at GoScale Technologies.
- **Full Stack Developer** at ReportGarden Technologies.
- **Intern** at IFB Industries.
- **Intern** at Center for Development of Imaging Technology.

Organisations

ReportGarden Technologies Full-Stack Developer [2016-2018]

Tribelocal Developed a product aimed at helping business owners manage their online presence, delivering 7 distinct core features at a fast pace. Developed the product from the ground up, tinkering with various libraries and exploring the Rails stack. Setup webpack to optimise the app's performance on the browser and allow for modular code structuring. Working alongside the CEO (Ashok), which helped in developing a product and market line of thought.

Helium Was tasked to design and implement a data pipeline allowing our primary product to consume marketing data from hundreds of APIs, centralising data operations. I was also accounted for deciding some key infrastructure choices to prepare for the volumes of data - making it an extensively scalable solution to the increasing server loads for ReportGarden.

Architecture:

- o Used lambdas as the primary compute sources for the data pipeline and configured API Gateways to trigger necessary lambdas. The entire microservice architecture was setup using Serverless.
- o Incorporated DynamoDB as the primary storage alongside a synchronized Elasticsearch cluster as query-able secondary data source.
- o Implemented job scheduling architecture using SQS, SNS, and CloudWatch, and scripted the deployment processes of the entire architecture.

Key Successes:

- o Understanding the generic requirements of ReportGarden and the expectations from the data pipeline such as aggregations and segmentations.
- o A robust framework was developed to facilitate faster integration developments onto the pipeline.
- o The framework did not only abstract common operations but also enforce a mindset of viewing the data pipeline and the kind of requests it catered to.
- o Developed wrappers to interact with all the technologies used, so as to provide a Rails like development experience.

Gauges Was tasked to revamp and maintain a prestigious relic product (an antecedent to Google Analytics). The product once acquired by purchase was rested solely on me to change the complete stack onto React. I was tasked to accomplish this managing a team of remote contractual developers. The projects main success was the detail added onto the UI.

GoScale Technologies Full-Stack Developer [2019 & 2022]

Developed a robust back-end order management service capable of integrating into the existing plethora of e-commerce systems in place, for a major retailer in Thailand. Developed the task flow structure with database hooks across multiple storage infra. The system ('**OMS**') was set to act as the brain of the entire e-commerce operation while integrating and monitoring a multitude of orders and personnel. The system also provided hooks to integrate for further functionalities such as reporting and invoicing.

Having good rapport with the CEO (Raghu), I chose to again work with him in late 2022. I was fortunate to work on a project using Chat GPT. Though my work primarily building the

frontend environment for an interactive blog writer, with clear steps and informative outline options, I was able to grasp the fundamentals of AI prompting. The product was titled **WordRocket**

Rapidue Technologies Frontend Developer [2020]

Was hired to develop web-apps virtualising the processes in large scale waste disposal for all scales of industries. After KT on the all the stake holders of the waste collection systems, different portals were built for each role. Being hired for my React prowess, I was tasked to setup a Redux state suited for the app's operations and different modes. I lead the front-end development, with 2 others, delivering a stable product with a market place – allowing multiple roles of the waste management work chain to interact here. Also developed the admin portal for the customer representative (operations) team.

Phoenix Technologies Senior FrontEnd Developer [2021]

I was primarily tasked at improving the UI and UX of their existing virtual conferencing software, **Zuddl**. Was able to add scheduling features on the app, which had to respect the presenter and audience's timezone differences. Used GreenSock.js to animate an interactive wall of banners and promotions. Further on, I implemented some key virtual presence features, stitching the user flow from one module to another. Implemented back-end logic also when necessary. Added multiple aesthetic elements and transitions, while conversing all details with the lead designer.

EngineeringSquare Technologies Senior FrontEnd Developer [2023]

Was hired to take up the lead front end development of their feature product, **InterviewCube**, aiming to provide on-demand proctored environments for hiring clients. The project was to be built on React, assembling all necessary features such as Video Conferencing, Interview Scheduling along with pod selection (test centres across USA). The main responsibility was to integrate all APIs and evaluate the flows, from the Candidate and Client perspectives. The project was left close to completion, as I had other intermittent plans. The key contribution to the project was the code structuring emphasised, separating business and library logic, which not only builds for cleaner code, but allows reusability of code (library/business) for further projects they undertake.

MyTeru Technologies Senior FrontEnd Developer [2026]

Was hired to help the CEO(Manoj) with the rapid front end development of their feature product, MyTeru, aiming to build **loyalty** among mid-scale businesses and their customers. The project was being built on ReactNative, and I had to quickly grasp the fundamentals of mobile app development and contribute. The main responsibility was to build multiple features into the budding app and make the app rich with sensible ideas. I was a key part of the product discussions of how the app handled various user scenarios and such. I left the team after all the features were developed and the product was looking into the sales and marketing endeavours.

Internships

IFB Industries Intern [2016]

After some project interviews, I was able to convince my mentor of my programming zeal. And having an electronics background, I was chosen to solely build a preliminary IoT hub, which involved collecting data from machine circuit outlets. Used X-Bee and Raspberry Pi to setup a data collection hub right in the plant. Further I developed an app, using C#, consolidating and showcasing the data and more performance metrics as requested.

Center for Development of Imaging Technology Intern [2015]

A work-integrated system capable of registering complaint from end-user and navigate it to the custom self-developed mailbox of the concerned department personnel based on compliant information and the manager's directions added on to the complaint. All the functionality has been deployed on web pages with a neat and usable interface. Further extra features were added such as threading of a complaint to view the complaints flow across the department hierarchy, messaging system, file sharing.

Looking Ahead

With the changes in technology, its development and mainly the nature of products and their scope, obviously describing the AI revolution, I have started to learn the concepts of Machine Learning and Deep Learning. Guided by the wealth of knowledge online, I am also absorbing the mathematical foundations required in this space. Using Google's cloud resources, I am preparing for certifications building my credibility in this area. I soon hope to build professional experience by solving a real-world problem using Artificial Intelligence.
